

### Thirteenth International Olympiad, 1971

#### 1971/1.

Prove that the following assertion is true for  $n = 3$  and  $n = 5$ , and that it is false for every other natural number  $n > 2$ :

If  $a_1, a_2, \dots, a_n$  are arbitrary real numbers, then

$$1. \quad (a_1 - a_2)(a_1 - a_3) \dots (a_1 - a_n) + (a_2 - a_1)(a_2 - a_3) \dots (a_2 - a_n) \\ + \dots + (a_n - a_1)(a_n - a_2) \dots (a_n - a_{n-1}) \geq 0$$

#### 1971/2.

Consider a convex polyhedron  $P_1$  with nine vertices  $A_1, A_2, \dots, A_9$ ; let  $P_i$  be the polyhedron obtained  $P_i$  by a translation that moves vertex  $A_1$  to  $A_i$  ( $i = 2, 3, \dots, 9$ ). Prove that at least two of the polyhedra  $P_1, P_2, \dots, P_9$  have an interior point in common.

#### 1971/3.

Prove that the set of integers of the form  $2^k - 3$  ( $k = 2, 3, \dots$ ) contains an infinite subset in which every two members are relatively prime.

#### 1971/4.

All the faces of tetrahedron  $ABCD$  are acute-angled triangles. We consider all closed polygonal paths of the form  $XYZX$  defined as follows:  $X$  is a point on edge  $AB$ , distinct from  $A$  and  $B$ ; similarly  $Y, Z$  are interior points of edges  $BC, CD$ . Prove :

1. If  $\angle DAB + \angle BCD \neq \angle CDA + \angle ABC$ , then among the polygonal paths there is none of minimal length.
2. If  $\angle DAB + \angle BCD = \angle CDA + \angle ABC$ , then there are infinitely many shortest polygonal paths, there is none of minimal length.
3.  $\angle DAB + \angle BCD = \angle CDA + \angle ABC$ , then there are infinitely many shortest polygonal paths, their common length being  $2AC \sin(\alpha/2)$ , where  $\alpha = \angle BAC + \angle CAD + \angle DAB$

#### 1971/5.

Prove that for every natural number  $m$ , there exists a finite set  $S$  of points in a plane with the following property: For every point  $A$  in  $S$ , there are exactly  $m$  points in  $S$  which are at unit distance from  $A$ .

#### 1971/6.

Let  $A = (a_{ij})$ ,  $i, j = 1, 2, \dots, n$  be a square matrix whose elements are non-negative integers. Suppose that whenever an element  $a_{ij} = 0$ , the sum of the elements in the  $i$ th row and the  $j$ th column is  $\geq n^2/2$ .
